

Mountains in Norway over 2000m with a prominence of at least 100m

Introduction

Information and names are taken from the Norwegian Statens Kartverk topografisk hovedkartserie M711, which is a series of 1:50 000 maps covering the entire country and also from the latest national park maps such as *Jotunheimen Vest* and *Jotunheimen Aust*. In a few cases (noted) peaks are unnamed on the 1:50 000 maps. In these cases, where possible, names are taken from the 1:100 000 Jotunheimen map. Any names in *italics* are not map names but are given to aid location. There are 130 peaks in Norway over 2000 m with a minimum col depth or prominence of at least 100 m. Of these 130 mountains, 20 peaks are 2300 m or higher. All of these 20 are in the Jotunheimen National Park. In fact the majority of the 130 mountains are within Jotunheimen. The remaining tops are in the areas surrounding Jotunheimen. If you are interested in further information, then there are several websites dedicated to the highest mountains in Norway and Scandinavia, including a site by James Baxter (www.scandinavianmountains.com) and one by the Norwegian Torgeir Eraker (www.nfo2000m.no). Torgeir has gone to great lengths to list all tops with a col depth of only 10 m. There is also an excellent 553 page book in Norwegian called *Norges Fjelltopper over 2000 meter* by Morten & Julia Helgesen, ISBN 82-997013-0-9. This list was last updated in July 2015. Enjoy!

Abbreviations

Any map abbreviations have been kept throughout, for example "st" is Store meaning Great. Where these names have been added to aid location, the additional part of the name has been added after the main mountain name and in *italics*, for example Bukkeholstindan *store*. Other words translate as follows: vestre - western, midtre - middle, østre/austre - eastern, nordre - northern and søre - southern.

Grouping of the 2000m mountains

The mountains have been grouped into the main naturally occurring massifs within Jotunheimen, the outlying areas and the Rondane National Park. This is appropriate from the point of view of both access and tackling the mountains. The peaks are ranked in order of height, with number 1 being Galdhøpiggen, the highest mountain in Norway. If two peaks have the same height, then the peak with the greater prominence is ranked highest. The groups are shown below. The lists begin on the next page and end with a single complete list of all summits. First ascents by Slingsby and Hall are also highlighted.

Galdhøpiggen massif	(northern Jotunheimen)	Memuru massif	(eastern central Jotunheimen)
Glittertind & Kviting skjølen massifs	(north eastern Jotunheimen)	Gjende to Bygdin	(south eastern Jotunheimen)
Stølsnos, Uranos & Mjølkedal areas	(southern central Jotunheimen)	Hurrungane	(western Jotunheimen)
Smørstabbs massif	(north western Jotunheimen)	Raudal to Urdadal	(central Jotunheimen)
Skjåkfjella		Dovrefjell	
Jostedalsbreen		Reinheimen	
Rondane			

Anomalies with other lists

As usual with lists, there are often anomalies. Having checked the data against the mapping and against both Baxter's and Eraker's lists and the book mentioned, I have found the following differences:

- Included in this list - Hestbrepiggen *vestre* pt 2139m, in Breheimen, has a col depth of 112m (Norges Fjelltopper over 2000m indicates 150m), not 50m as indicated by Eraker.
- Included in this list - Bukkeholstinden pt 2149m, in the Galdhøpiggen massif, has a col depth of maximum 89m according to the glacier level on the mapping, however newer measurements give a col depth of 100m which is adopted by both Eraker and Norges Fjelltopper.
- Included in this list - Trollsteinseggje with a height of 2300m and a col depth that now exceeds 100m due to the receding glacier (measured prominence of 106m on the 3rd of July 2015).

Not included below, but a valid member of a list of Norwegian mountains, is the active volcano Beerenberg (2277 m) on the 373 km² arctic island of Jan Mayen located off the east coast of Greenland.
